**230 quotes from women
building with AI.**

Almost none say

“I can’t write code.”

**FROM OUR RESEARCH
ON WOMEN BUILDING WITH AI**

SWIPE →

**GitHub, databases and
deploying are where you
get stuck.**

"I was just scared of clicking
something wrong"

a designer, publishing her first build

It works. You still **can't**
tell what it's doing.

"The problem is I can't judge what
it's doing."

a woman in r/ClaudeAI

Going in circles costs money.

"a newbie like me blew through the 100 credits in less than a week"

"...3 AM, staring at my screen, trying to convince an AI to fix the same bug for the dozenth time"

**There's no spare hour for
this, and no one to ask
when you're stuck.**

"...those little pockets of time between
naps, bedtime, family life, bugs,
rejected builds..."

"Building this alone has been empowering,
yes. But also confusing, frustrating, and
honestly quite lonely."

And then someone tells you
it doesn't count.

"So you're just a vibe coder? I have
no interest in games made by AI."

a reply to a woman announcing her solo
game studio

None of this stops once
your first build works.
We built Little Parrot
with Lovable, and
customers pay for it.
Every step we teach is
one we had to work out
ourselves.

Feeling alone, and being
told what you built
doesn't count, both take
a community. Publishing,
fixing and charging take
skills. That's the
learning path we're
building.

You can apply every step to your own app.

Make a change, and undo it when it breaks

Check what happens to a customer's data and money

Fix a bug with evidence instead of another prompt

See where people give up, and test a price

We're a product manager and a software engineer, and we're building this learning path out of exactly these problems.
