

What do frontend, backend and database actually mean?

Picture a bakery. 🥐

KNOW WHERE TO POINT YOUR AI BUILDER .
SWIPE →

The counter is your
FRONTEND: everything users
see and touch.

Buttons, forms, colours. It runs on
their device.

Also called the client.

The kitchen is your
BACKEND: the work
customers never see.

Saving data, sending emails,
taking payments.

The storage room is your **DATABASE**: where your app remembers.

Profiles, orders, posts, all organised
and findable.

The building is a **SERVER**:
the computer your backend
and database run on.

You rent rather than buy. That's CLOUD COMPUTING,
and Lovable handles it for you.

The phone line to the mill who supplies the flour is an **API**: how your app talks to other apps, like Stripe.

The API KEY is the access code. Keep it secret: it never goes in a prompt.

**Next time something
breaks, you'll understand
better what happened.**
