I left my full-time job at the end of 2024, after 10 years in tech. This is what running my own business has been like since.

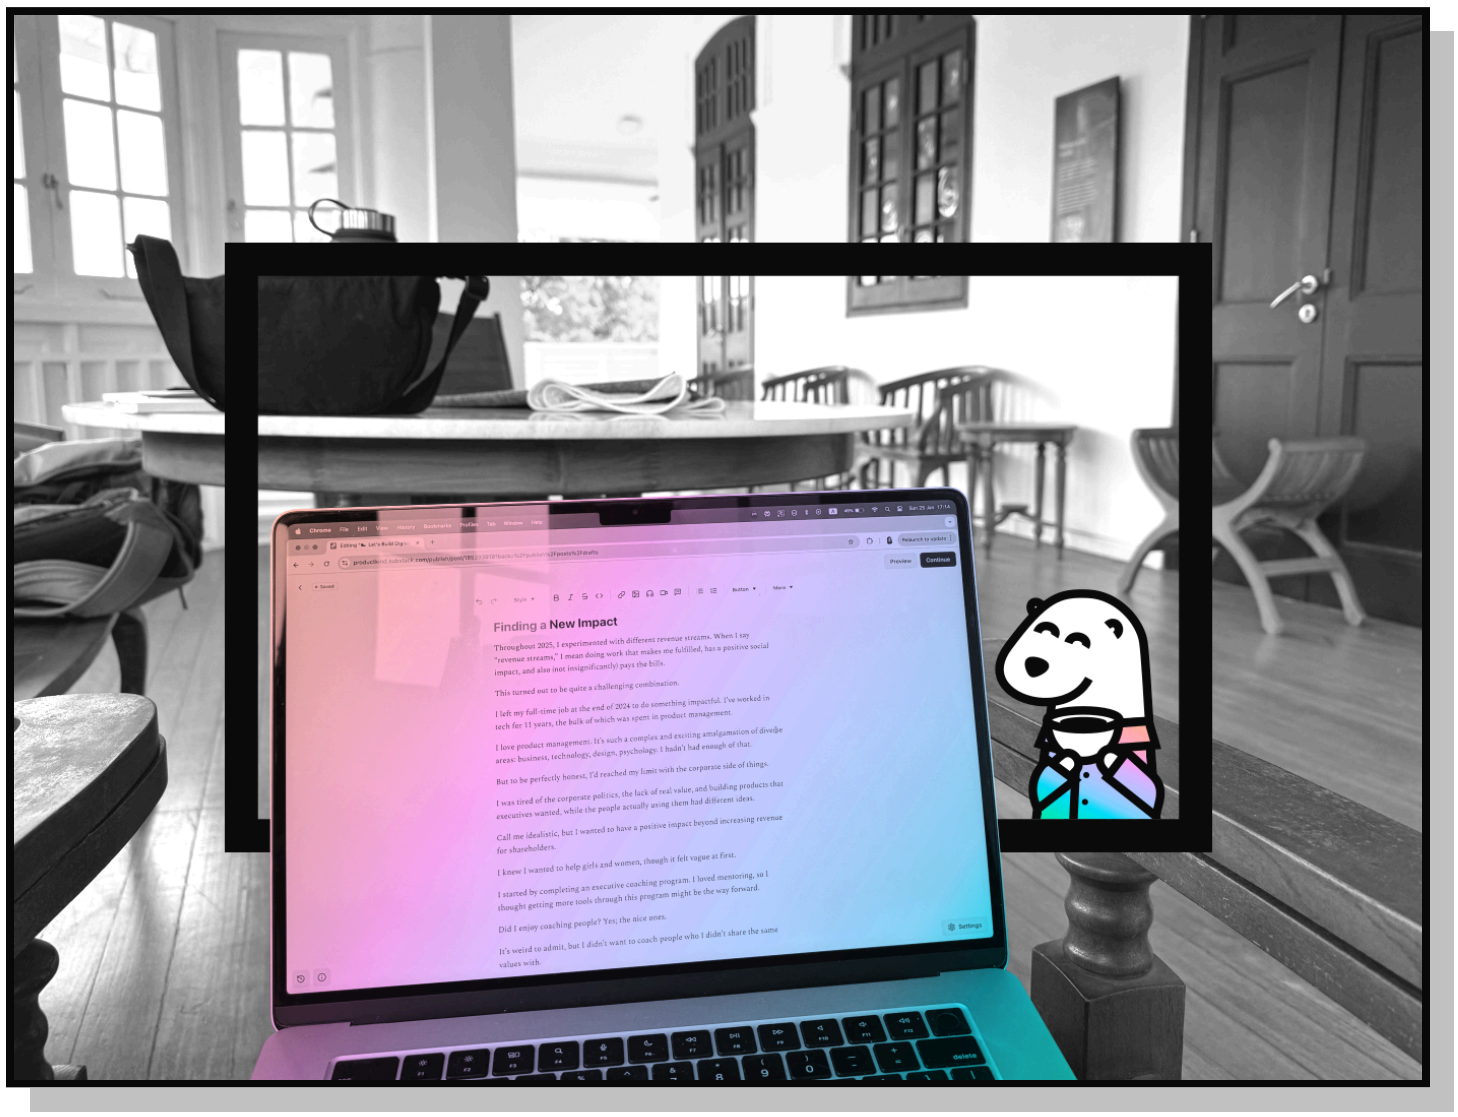

FROM EMPLOYEE TO RUNNING A BUSINESS.

SWIPE →

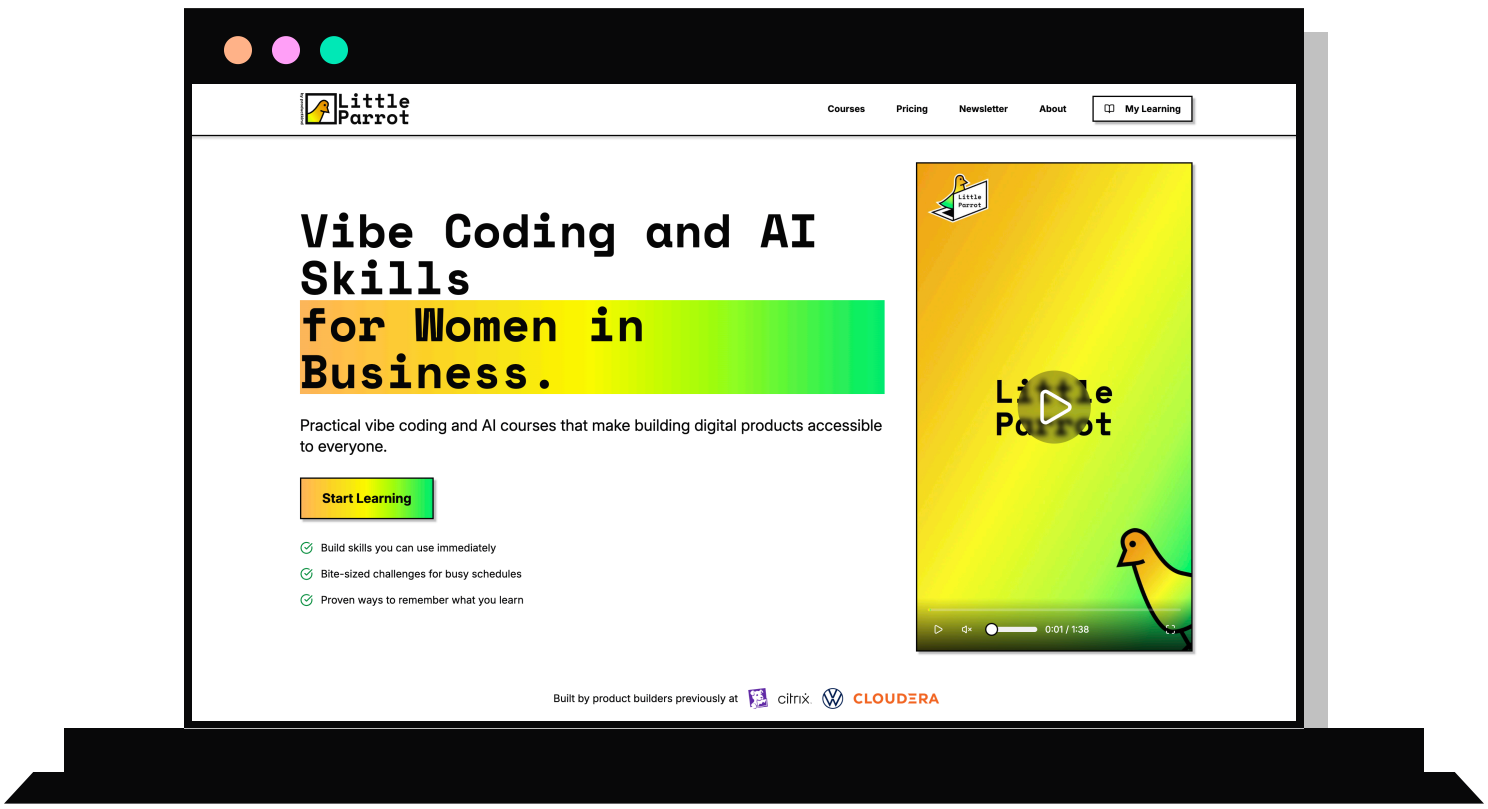

I love product management. It's such an exciting mix of business, technology, design and psychology.

But I was tired of the corporate politics, and of building products executives wanted while the people using them had different ideas.

Call me idealistic, but I wanted a positive impact beyond shareholder revenue.

I started with an executive coaching programme. Did I enjoy coaching people? Yes, the nice ones. 😅 I also knew I wanted the **freedom** to work from anywhere.

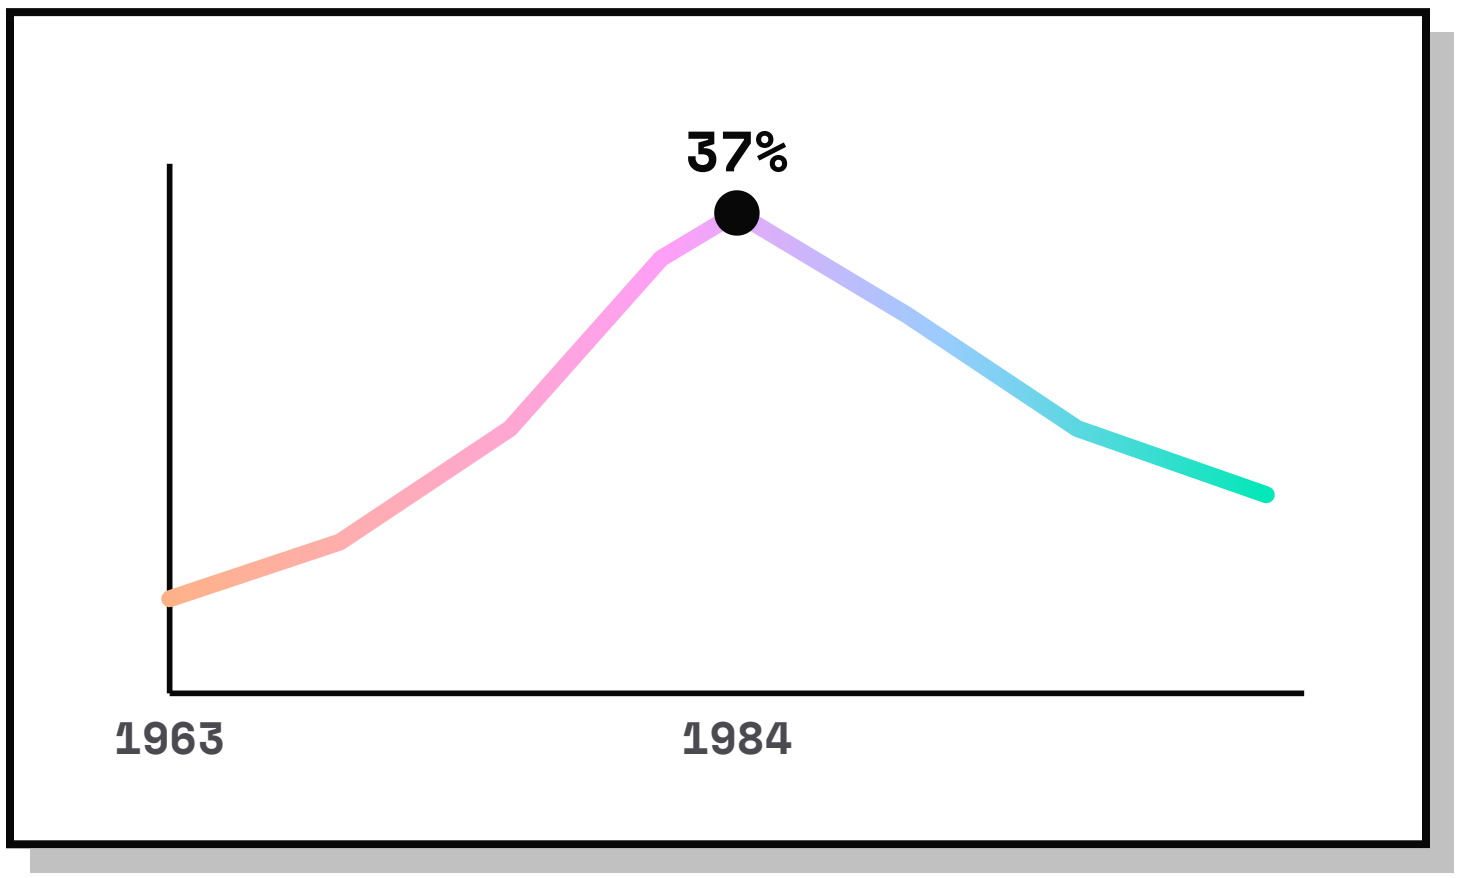

Then I discovered **vibe coding**: building software with AI tools, without having to know how to code. I started building products, even though I don't know TypeScript. It was such an empowering feeling that I gave talks and ran workshops about it, and started building Little Parrot, a microlearning app.

In the autumn I joined **SheBuilds on Lovable**, a 48-hour hackathon for women. There I saw a sea of professional women with ideas they wanted to build.

But most vibe coding content is made by tech bros, for tech bros.

This has happened before. The term 'software engineer' was coined by a woman, **Margaret Hamilton**, in 1963. By 1984, women earned 37% of computer science degrees in the US. Then personal computers were marketed almost exclusively to boys and men, and the numbers began to drop.

14%

Now a new technology is here: generative AI. Yet only 14% of Lovable's users are women, and you can only benefit from AI by using it. So we've refocused our two-person company, productkind, on one mission: **closing the gender gap in AI adoption**.

Nobody has ten years of experience in vibe coding yet. **We're all starting from the same line.** I'll be sharing what I try, what works, and what definitely doesn't in my newsletter, Thoughts by productkind.
