Little Parrot teaches women to build apps, tools and systems with AI, without a technical background.

I’m Kinga. I started my career in luxury fashion. It was interesting, but the culture wasn’t for me. Then I moved countries and joined a tech company.

Over 10 years in tech, I worked in different roles, did a developer bootcamp, and eventually became a Lead Product Manager. I love building products and bringing different perspectives together.

I wanted my work to have a more meaningful impact, beyond increasing revenue for shareholders. So I left my full-time product role and started my company, productkind.

I knew I wanted to help women. I had no idea what that would look like yet. I tried coaching. I consulted. I experimented.

I started building productkind's first product, Little Parrot. At first, it was for product managers. Then I saw a much bigger opportunity: closing the gender gap in AI adoption.

Tamas joined as my technical partner and educator. We started rebuilding it around a simple goal: help women build what felt impossible before AI.

Then people we didn't know started learning with us. 663 people registered for our free course that we offered on International Women's Day. Then someone we didn't know paid for one. Then another. And another. From South Korea, England, the US, Australia...

Little Parrot is made by the two of us at productkind: short, science-based, hands-on courses for women with ideas they want to build, whether or not they see themselves as technical.

Maybe you have an idea too. We believe the best way to learn is to make something, so that's what you do in every course.
